(54) ELECTRONIC PROGRAM GUIDE ON QUESTION BASE

(57)Abstract:

PROBLEM TO BE SOLVED: To provide an EPG (electronic program guide) which can easily retrieve the programs by producing questions to identify the programs to be watched by viewers and presenting the

retrieved programs to the viewers

the programs via an EPG.

SOLUTION: A receiver 50 rearranges the video, audio and programming data from a digital transport packet. A contents separator 74 separates the video and audio data from the programming information. The separated video and audio data are sent to a tuner contained in a viewer computing unit 60, and the video data are shown on a monitor 62 after a specific channel is selected. The contract of the properties of the properties

into an EPG data base 72. Thus, the viewer can select

1. Title of Invention

QUERY-BASED ELECTRONIC PROGRAM GUIDE

2. Claims

 A method for operating an electronic program guide comprising the following steps:

collecting viewing preferences of a viewer; and

developing a query for identifying programs based upon the viewing preferences of the viewer.

- A method as recited in claim 1, wherein the collecting step comprises
 the step of monitoring viewing habits of the viewer as an indication of the viewing
 preferences.
- A method as recited in claim 1, wherein the collecting step comprises the following steps:

creating a viewer profile of the viewer; and

correlating the viewer profile with other viewer profiles to infer the viewing preferences of the viewer.

- A method as recited in claim 1, further comprising the step of presenting, to the viewer, a list of programs identified by the query.
- 5. A method as recited in claim 4, further comprising the step of ordering the list of programs to group programs which the viewer is more likely to watch in one part of the list and programs which the viewer is less likely to watch in another part of the list.

 A method as recited in claim 1, wherein the collecting step comprises the following stees:

conducting the query; and

assembling the programs identified by the query as a viewer program set through which the viewer can sequentially cycle.

- A method as recited in claim 1, further comprising the step of saving the query in a hierarchic query structure.
- An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 1.
- A viewer computing unit programmed to perform the steps of the method recited in claim 1.
- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 1.
- 11. A method for operating an electronic program guide comprising the following steps:

logging an amount of time that a particular channel is selected for viewing; and

generating a query to identify channels based upon a percentage of the time that the channels are selected. A method as recised in claim 11, further comprising the following steps:

presenting, to the viewer, a list of the channels identified by the query, and ordering the channels within the last seconding to the percentage of time that the channels are assected for viewing so that channels which are selected a higher proceedage of the time appear at one place in the list and channels which are selected a lower processage of the time appear at another place in the list.

- 13. A method as received in claims 11, further comprising the step of generating a query to identify channels which have been selected at least a threshold amount of time to eliminate rarely selected channels from identification.
- A method as recited in claim 11, further comprising the step of saving the query in a hierarchic query structure.
- An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method resited in claim 11.
- A viewer computing unit programmed to perform the steps of the method recited in claim 11.

- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 11.
- 18. A method for operating an electronic program guide comprising the following steps:

defining a first query for identifying programs preferred by a first viewer, defining a second query for identifying programs preferred by a second viewer and

creating a unified query which combines the first and second queries to jointly identify the programs preferred by at least one of the first and second viewers.

- 19. A method as recited in claim 18, wherein the creating stop comprises the step of combining the first and second queries according to a logical OR function.
- A method as recited in claim 18, further comprising the following steps:

conducting a search of programs available on the electronic program guide using the unified query; and

presenting the programs that satisfy the unified query.

- 21. A method as recited in claim 18, further comprising the step of automatically generating at least one of the first and second queries based upon viewing preferences of the respective first and second viewers.
- A method as recited in claim 18, further comprising the step of saving the queries in a hierarchic query structure.
- An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 18.
- A viewer computing unit programmed to perform the steps of the method recited in claim 18.
- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 18.
- A method for operating an electronic program guide (EPG) comprising the following steps:

defining a first query for identifying selected programs in an EPG database;

defining a second query for identifying selected programs retrievable from a site on the Internet; and

creating a unified query which combines the first and second queries to jointly identify the selected programs.

- A method as recited in claim 26, further comprising the step of saving the queries in a hierarchic query structure.
- 28. An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 26.
- A viewer computing unit programmed to perform the steps of the method recited in claim 26.
- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 26.
- 31. A method for operating an electronic program guide comprising the following steps:

defining a query to identify a topic of interest to a viewer;

storing the query;

periodically executing the query to determine if there are any programs which relate to the topic; and

automatically notifying the viewer when the query identifies a program related to the topic.

32. A method as recited in claim 31, further comprising the step of automatically initiating procedures to record the program related to the topic.

4

- A method as recited in claim 31, further comprising the step of saving the query in a hierarchic query structure.
- An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 31.
- A viewer compating unit programmed to perform the steps of the method recited in claim 31.
- A computer-readable storage medium which directs a computer to '
 perform the steps of the method recited in claim 31.
- 37. A method for operating an electronic program guide (EPG) as a viewer uses one or more numeric keys to enter data, individual ones of the keys also corresponding to one or more associated letters, comprising the following stem:
- constructing a query, based on the entered data, which considers that the entered data might represent a number or a letter associated with the numeric key used to enter the data; and

identifying any EPG data item that satisfies the query.

 A method as recited in claim 37, further comprising the additional stop of repeating the steps of constructing and identifying for each key entry.

- A method as recited in claim 37, wherein the steps of constructing and identifying are performed after multiple key entries.
- 40. A method as recited in claim 37, further comprising the additional step of presenting, to the viewer, said any EPG data item which satisfies the query.
- A method as recited in claim 37, wherein the constructing step comprises the following steps:

formulating one or more letter sub-queries for each letter corresponding to the key used for entry;

formulating a number sub-query for each number corresponding to the keyused for entry; and

formulating the query as a combination of the letter and number subqueries.

42. A method as recited in claim 37, wherein the data is a result of more than one key entry, and the constructing step further comprises the following steps:

interpreting the data for each key entry as representing both the number and the associated letters corresponding to the key;

formulating multiple sub-queries for each sequence of key entries which considers different interpretations of the data within the sequence; and

formulating a composite query as a combination of all the sub-queries.

- 43. An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 37.
- 44. A viewer computing unit programmed to perform the steps of the method recited in claim 37.
- A computer-readable storage medium which directs a computer to perform the stops of the method recited in claim 37.
- 46. In a viewing computing unit which can be controlled through anumeric keypad having numbered keys, the keys further corresponding to one or more associated letters, a method comprising the following steps:

generating key data as a key is activated:

interpreting the key data as representing both a number associated with the key and the one or more letters associated with the key, and

determining possible operations which can be performed by the viewer computing unit for different interpretations of the key data.

- 47. A method at revioled in claim 66, wherein the numbers are used to identify a channel and the letters are used to identify a program or network name, the method fatherhr comprising the stop of mapping the one or more letters associated with the key to the number associated with the key to th
- 48. A method as recited in claim 46, further comprising the additional step of repeating the steps of generating, interpreting, and identifying as each key is activated.
- 49. A method as recited in claim 46, wherein the interpreting and determining steps are performed only after the step of generating key data has been performed for all activated keys.
- 50. A method as recited in elsim 46, wherein the interpreting step comprises the following steps:

formulating one or more letter sub-queries for each of the one or more letters associated with the key;

formulating a number sub-query for the number associated with the key; and

formulating a composite query as a combination of the letter and number sub-queries.

 Å method as recited in claim 46, wherein more than one key is activated, further comprising the following steps:

generating a sequence of key data;

formulating multiple sub-queries for the sequence of key data which considers the different interpretations of the key data within the sequence, and

formulating a composite query as a combination of all the sub-queries.

- A method as recited in claim 46, further comprising the step of saving the query in a hierarchic query structure.
- A viewer computing unit programmed to perform the steps of the method recited in claim 46.
- 54. A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 46.
- 55. A method for operating an electronic program guide comprising the following steps:

creating a restriction query having one or more search parameters; and precluding selection of any program, channel, or network which satisfies the search parameters in the restriction query.

- 56. A method as recited in claim 55, wherein the search parameters are selected from a parameter group comprising genre, sub-genre, rating, time of day, and length of time watched.
- 57. A method as recited in claim 55, further comprising the step of saving the query in a hierarchic query structure.
- 58. A method as recited in claim 55, further comprising the step of saving the query as an icon.
- An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited
 in claim 55.
- A viewer computing unit programmed to perform the steps of the method recited in claim 55.
- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 55.
- 62. A method for operating an electronic program guide comprising the following steps:

creating queries for locating a program, channel, or network; and saving the queries in a hierarchic query structure.

- 63. A method as recited in claim 62, wherein the saving step comprises saving the queries as icons.
- 64. A method as recited in claim 62, further comprising presenting, to a viewer, a organization chart representing the hierarchic query structure.
- 65. A method as recited in claim 62, further comprising retrieving a query from the hierarchic query structure.
- 66. An electronic program guide resident in a computer-readable storage medium and executable on a processor to perform the steps of the method recited in claim 62.
- A viewer computing unit programmed to perform the steps of the method recited in claim 62.
- A computer-readable storage medium which directs a computer to perform the steps of the method recited in claim 62.
- A computer-readable storage medium having a hierarchic query structure stored therein which is formed as a result of the steps of the method recited in claim 62.
 - 70. A viewer computing unit, comprising: a processor; and

an electronic program guide (EPG) encouring on the processor to organize programming information descriptive of programs, the EPG being configured to collect viewing preferences of a rieser and to autoenstically develop a query for identifying programming information based upon the viewing preferences of the Viewer.

71. A viewer computing unit as recited in chaim 70, further comprising a momenty to store a profile of the viewer which indicates the viewer's characteristics, the EPG being configured to automatically develop the query based on the viewer profile.

 A viewer computing unit as recited in claim 70, further comprising: a memory, and

the EPG being configured to log the viewer's viewing habits in the memory and to automatically develop the query based on the viewing habits.

 A viewer computing unit as recited in claim 70, further comprising: a memory; and

the EPG being configured to stere the query in the memory within an organized, hierarchic structure.

- 74. For execution on a processor of a viewer compating unit, an electronic program guide (EPG) executing on the processor to organize programming information, the EPG being configured to enable multiple viewers to create queries for locating particular programming information, the EPG further creating a composite query that combines the queries of the viewers.
- 75. For encousion on a processor of a viewer computing unit, the viewer computing unit having a display, an electronic program guade (EPG) executing on the processor to organize programming information, the EPG supporting a graphical tuser interface which can be abown on the display and being configured to periodically and automatically execute a query and to present on the user interface an obligation when the every inconstant.
- 76. An electronic programming guide as recited in claim 75, wherein while the display is showing a program, the EPG is configured to execute the query in background without interruption of the program.

....

77. For excusion on a processor of a viewer computing unit, whereis the viewer computing that has sumhered keys which additionally correspond to one or more essociated letters, each key generating key data when a viewer activates the key to request programming information, as electronic program guide (EPG) executing on the processor to organize programming information, the EPG being configured to interpret the key data are operating both as unther associated with the key and one or more letters succeisted with the key, the EPG being further configured to determine possible programming information that the viewer is Ricky to be requesting based on different interpretations of the key data.

3. Detailed Description of Invention

TECHNICAL FIELD

This invention relates to entertainment potents, such as interactive television or interactive computing activors, systems, and to electronic protection for against which operate in conjunction with these systems. More periorizally, this invention relates to activode for operating electronic program guides using auto-generated and viver-generated quoises to identify programs or other programming information.

BACKGROUND OF THE INVENTION

Television viewers are very familiar with printed programming schedules that appear in daily newspapers or weekly magazines, such as TV Guide®. The printed program guide lists the various television abows in relation to their scheduled viewing time on a day-to-day basis.

Chief TV systems often suchule a channel with a video broadcest of the printed program guide. The cable channels in definition to displaying listings of programs available on the different available channels. The listings are commonly arranged in a grid. Each column of the grid represents a particular time slot, such as 4:00 pm. to 4:30 pm. Each row represents a particular broadcast or cable channel, such as ABC, PBS, or ESPN. The various scheduled programs or shows are arranged within the rows and codumns, indicating the channels and times at which they can be found. The grid is continuously acrolled vertically so that a viewer watches a continuously refreshing set of programs within three or four time slots.

Data for available programs is typically received by a cable system as a plurality of data records. Each available program has a single corresponding data

record indicating a variety of information about the program such as its channel, its starting and ending times, its title, natures of starting actors, whether closedcaptioning and there one available, and perhaps a beind description of the program. It is not difficult to format a grid such as described above from this type of deat records. The grid is typically formatted case at the cable system's headend and treadsour repeatedly and continuously to the threatents of homes served by the cable system.

Newer, interactive cable distribution systems feature electronic program guides (EPGs) which function somewhat similar to the broadcast program listing channels described above. Rather than recoiling automatically, however, an EPG allows a viewer to use a remote control device or other input device to accold as relative to the broizontally and vertically strong as morporame grid. This functionality utilities the two-way communications capabilities of interactive cable systems.

The EPG is typically implemented in software which runs on a set-top box (STB) connected between a TV and a cable system home entry line. When scrolling to a new column or row, the set-top box inserts the appropriate programming information into each sew row or column. This information is either cached at the STB or recuested from the cable system' is headered.

Intensive systems permit viewen to control what programs are shown on their TV and when. Movies-on-demand is one example of this intensive control. A viewer can pensus a list of available movies from the EFG, and then order a selected movie. The STB sends a request for the movie to the headend server. The movie is retrieved and transmitted to the requesting STB. Movies-o-demand that matther viewers to to the, purchase, and words a movie as their convenience, as opposed to being restricted to certain start times as is typical with conventional promium or pay-per-view channels.

Many industry and commencial experts expect entertakazent systems to evolve to the point of officing many other interactive services to the consumers. For instance, consumers will be able to use their TV or computer to shop for groceries or other goods, conduct beaking and other financial transactions, play games, or attend debatefroat courses and take catams.

Conventional distribution networks support many channels. It is common for a TV antisense to have 50 to 100 channels. However, as technology improves and programming content continues to expand, the number of channels are reported to increase dramatically to many hundreds, or even thousands of channels.

One problem with the growth in the number of channels is that varily unlarged selection, while appealing to a viewer, with make it more difficult for a viewer to locate programs of their preference. Traditional medical of locating programs—such as memorizing channel sumbers, scanning programs grids, nor another mering—will become less effective as the number of channels indicate for example, imagine the difficulty in trying to present bundered or channels for programs in a scoulable grid-like POV user interface (UU, which might show only a few programs or channels at one time. This UI structure will most likely be sunventable for large programs and channel offentage. Additionally, surfing through bundereds or boscumbs of channels will likely occurred as the programs of the formula bundereds or boscumbs of channels will likely occurred as preferrings bundered or boscumbs of channels will likely occurred as first.

It is also likely that the traditional practice of relating programs and actworks to specific channels will become less meaningful as the number of channels increases. Suppose, for example, a viewer might be interested in watching foodbell. Today, a viewer might remember that channel 6 (NBC) and channel 3 (FOX) carry the football games and simply tens to one of these channels. In the future, however, there might be football games being broadous or channels 76, 495, and 1042. These channels might be small local stations that are broadcasting their local football items, or one of many channels used by a major network. Viewers are not blody to remember that channels 78, 495, and 1042 are carrying football games at specific fines.

Moreover; the correlation of channels to networks and programs vary from market to market. For instance, the sports network ESPN might be curried on channel 15 in one market and on channel 29 in another market. Memorizingprogram officings in terms of channel numbers will prove flustrating as a viewer travels from one market to the next.

Accordingly, there is a need to develop operating methods which allow viswers to easily find programs or networks regardless of the channels on which they are carried. Additionally, these operating methods should enable viewers to locate programs regardless of whether they remember the channel number, programs may on prevent sease.

Toward this end, a company named TVFsot, line, has developed a softwarebased product "ETV" which assists a viewer in locating peritcular programs. The ETV system cognitizes the different programs offerings according to different topical categorizes. Fig. 1 shows an example screen display of a graphical user unterface (UI) window 20 supported by the ETV system. The ETV window 20 has a first pance 22 that line alphabetically predefined types of programs, such as Business, Children, Educational, Grame Shows, and to oftent. The viewer can custom à Rouré fance or highlighte à 24 to choose a type of program from the first pance 22. A second pance 25 de choise a litt of programs that are available for program type highlighted in the fart pance 25. La this causagie, the type "business" is highlighted, and hence business-related programs are shown in the second pance 26. The second panc 26 also provides other programming informatics including start time, network or sention, and dentation.

The ETV system throwly offers an alternative to a scotlable grid presentation which organizes programs according to type. This allows the viewer to select a programs type, and then review the programs offered for this type. The ETV system also permits redimentary "nearth" capabilities. Fig. 2 shows another graphical UI window 30 which appears when performing a search. A first pass 32 contains a serollable alphabetical list of entitions, and allows a viewer to choose a station. A second pass 34 contains a serollable alphabetical list of entitions programs the contains a serollable alphabetical list of entition types from which the viewer may select a program type. Offer parameters, such as MICAA, rating, and start lieue, our also be activately by a viewer. Based upon these selections, the ETV system locates programs which are of a particular type, from the nelected station, and said for their and dust titues.

The ETV system is limited in many empores. The ETV reviews does not promit searches on arbitrary fields. Instead, the categories are pre-defined for the viewer. The viewer is not able to define liabler own complex searches using, for example, Boolean logic of "CR," "AND," and "NOTA. Another limitation is that be ETV system does all provide any extra controls which intelligently searches selections based upon viewer selections. An "active" control is an control that does not require any other action on the part of the sume. For instance, if a viewer decision and the control of the same. For instance, if a viewer part of the same whome of UR, 2), all proposes types with

be listed in the second pane 34. In fact, the same lists will always occur in both the first and second panes 32, 34 regardless of what sedections the viewer has previously made. The viewer is not able to see any results until the viewer activates a "Bestin" search key 16.

Accordingly, there remains a need to develop operating methods which decouple associations between the channel and network or program and also allow intelligent search procedures to better assist the viewer in locating preferred programs.

SUMMARY OF THE INVENTION

This invention concerns an electronic program guide (EPG) which enables creation of operates to facilitate simple and complex searches across predefined and arbitrary fields. The EPG organizes and presents programming information to a viewer. The EPG is implemented in software which executes on a processor resident in a viewer computing unit. As described berein, the viewer computing unit can be implemented as a set-top box (STB) connected to a television (TV), as a commoder and monitor, or the like.

According to one aspect of this invention, the EPG is configured to automatically identify programs that a viewer is likely to prefix. The EPG Collects viewing preferences of a viewer by, for example, monitoring and logging viewing habits of the viewer or through creation of a viewer profile in which a viewing memory a series of questions designed to discover the viewer's likes and dislikes. Based upon the three viewer preferences, the EPG automatically develops queries for identifying programs that the viewer is likely to watch and presents those programs to the viewer. The BFO can further be configured to merge the openins of individual viewers into a composite query which menches for programs on behalf of all viewers. Each where defines hashes on query. For instance, one family member might define a query for college bestevholl games, mother family member might define a query for Coll We programs, and another family member might define a query for college besteved games, as unafied query which combines the first query for control. The EVO then creates a unafied query which combines the first query for control.

The EFG awas queries in a hierarchic directure to make it easy for a viewer to organize and retrieve queries. The viewer one define directories and quadraturies to organize the queries. For instance, a viewer night armang queries for different kinds of movies within a Movie directory and queries for opports develow. Another example organization is to armage queries within a Sports develow. Another example organization is to armage queries within secontain used functions.

According to another spect, the EPG is configured to two quotes in hologrounds on the quotes are periodually exceeded subclassivant to the viewer. When the EPG intentifies a periodual programs assistiying the background query, the EPG intentifies all periodual programs are comparable assistantially intentifies the viewer of the programs. For example, suppose a viewer wants to watch shows on the Once Wall of China. The viewer can define a query for identify any programs mentioning the Gross Wall and have the query cannot in background, prehings for a long dentition of their. As the EPG identifies programs on the Great Wall, the EPG notifies the viewer of when the programs is subadued to be their, and to hair intentional procedures.

According to another aspect of this invention, the EPG assists a viewer in finding a program, channel number, or network by using a 10-key knypad as typically found on remote control handers. The knypad has ten numerical knyt, which also correspond to associated letters. When the viewer present a kny, the viewer might intend to be entering a number to find a channel, or one of the letters associated with the key for spelling the program or selvents. Then, Reguelless of the viewer's intent, the data generated when the key is depressed in the same. The EPG is configured to interpret the data as representing all possible choices, including the number and letters associated with the key. For intateo, when a viewer depresses the number "5" key, the EPG interprets that data to mean "5" or "1" or "K" or "L." The EPG then identified programs, channels, and networks which begin with or constitute the number or letters. As the viewer continues to enter each digit, the list of programs, channel, and networks dynamically sarrows.

After a few batton presses, the viewer is presented with a short list of possible choices.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Fig. 3 flows as extentionant system 40 according to one implementation of this invention. System 40 includes a centralized bendered or economy provided 42 which is configured to provide continuous volvo contents requires to multiple subsections. Frequence provided by centest provider 42 might include traditional trondwart TV shows, on-dement moving, games, and other services such as those commonly provided in the party to seek to compute services.

The content provider 42 applies video and other data over a distribution recovered 44 to the achieved. At the instruction, the network 44 to a satellite network which unassatis the data is a slight former from the content provider directly to individual solucities. The satellite servered 44 medicals a because the data of the satellite servered 44 medicals a because the satellite 45 and a receiving 65 the content provider as the satellite 45 and the implemented using DSS (Dieter Satellite System) technology, where individual solucities own small 15° receiving 65 these 50 which we resident at their bosnes. Video, audio, and other data are retiremented as diple former from the satellite transmitted 46 to the other grant and the satellite 45, where the data are redirected to the satellite receiver 50.

The distribution activing 44 can be implemented in other ways instead of DSS technology. One implementation is a multi-tier network which includes a high-speed, high-bandwidth fiber optic cable network between the content provider 40 and regional distribution nodes (not shows), and conventional home. earry lines, such as retired-pair lines or constain cable, between the distribution nodes and viewer computing units 60. Author network implementation might include traditional RP broadcoast technologies. The network can also be constructed using a conditionation of wireless and wire-based technologies.

Another approach boside to broadcasting the content to the subscribers is by multicasting the content over the lateract. With this approach, the content providers transmit the data content to a designated multicast address on the lateract. Subscribers listen to the multicast address to receive the primary content.

Each molecular residence has at least one viewer computing unit 60, in the illustrated implementation, the viewer computing unit 60 is embodied as a brondeste canabide personal computer, or simply "broudsast?". The brondester PC 60 has a large computer monitor 62, a processing unit 64, and input devices in the form of remote keyboard 66 and/or remote control hundret 68. The remote keyboard 66 and handered 68 are remotely coupled to the processing unit 64 via a wineless data like 70, such as inflamed (B) or radio (BP), addough the remotes come be directly connected. The broadester PC 60 also includes an EPG database 72 and a content separater 74, which are shown separately for illustration purpose, but one b incorporate from the processing unit 64.

It is noted that the viewer computing uset 60 can be implemented in other forms. For instance, the viewer computing usit 63 can be embodied as a set-top box coupled to a conventional television. Another implementation includes a TV or other visual display device, which has processing components incorporated therein.

Content provider 42 is configured to originate the broadcast programs or to rebroadcast programs received from another source, such as a satellite feed or arother cable system. In addition, the content provider 42 is configured to maintain a database of pergrams 80, such as finiture-length movies, post TV shows, genore, and other entertainment videos, which can be played individually to requesting subcerbers in an one-demand mode. These programs can be requested via a batc channel, such as a langulate link or internet link (described below). In the case of a cable hand network, the cable might function as both distribution channel and back channel to support interactivity. As technology continues to improve, the receiver 50 might be rephased with a transcriver which is capable of both receiving digital data force the satellite system, and transmitting data back across the satellite restem.

The content provider 42 includes a continuous media source 52 whichdistributes the digital video data streams kept in the programs database 80. The continuous media server and video programs database are implemented, for example, as a disk entry data storage system consisting of many large capacity storage disks. The video data streams of the movies are stored digitally on the storage disks: n predetermined or mapped locations. The locations of the video data streams are kept in a memory map and each video data stream is accessed through positives to the particular memory location. The continuous media server can service simultaneous requests for a program (even the same program) from many viewers.

The content provider 42 also has an program information server 84 to serve programming information to the viewer computing unit 60. The program information server 84 is implemented as a structured query language (SQL) database 86 with records containing information relating to available shows or programs.

The data structure 88 might also contain target specifications (memory pointer, hyperlink, etc.) to one or more target resources which mentain supplemental contents for the programs. The proglemental content than be stored, at any different content can be to ext. and served from, the content pravider 42 or from an independent service provider. The supplemental content can be text, hypermodic, appairs, video, picture, round, escentible code, or other multimodic types which enhance the broadcaste pregram. Examples of possible supplemental content include interactive questions or games related to the program, additional trivia on the movies or TV shows, advertisements, available medicinadities or other memonshila. Web pages to programs of similar type or starting the same actors/streetsers, and so on.

With reference again to Fig. 3, the content provider 42 broadcasts multiple programs for different serviceds and channels as one continuous digital dans feet, as is convertional in DSS. The EPO programming information is transmitted along with the video and multio data. The data is compressed and placed in digital transport packets for transmission over the stability system. If desired, the data portaming to particular channels or programs on the scrambled. The receiver 50 de-azambles and decompresses the data stream, and then reconstructs the video. sudo, and pregnamning data from the digital transport patents. The context papeator 74 represes the video and saido data from the prognamning information. The video/saido data is directed to a time in the visuer computing unit 60 which solven a particular channel and displays the video on the monitor 62 and plays the corresponding unite. The viserse control pregnam selection using the jobposed 60 or more control handers. St. The prognamning information is injust to the EPG database 72. By eaching the programming information in the local EPG database 72, thereteries functionality used to locate and select contain procurant form the EPG is handful colori.

The international system 60 also includes an independent service purvoker (ISF) 92 which distributes digital content to the viewer computing unit 60 over a second network 94. An example of the second network 94 is a public network, such as the Internet. The ISF 92 has an ISF hore 96 and a content dambate 98 to serve various multimodia content to the user. For instance, the ISF host 96 might store one or more target canousce (such as a Wab page) that one he rendered by the viewer computing unit 62.

According to the Tip. 3 management, the viewer computing unit 00 merces well-incomed breakment, or demand programme, and programming information from the content provider 42. The viewer computing unit 60 also receives supplemental interactive content in the content provider 42 or from the independent service provider 92. The block channel for facilitating interactive content is provided fromough network 94. The off-site supplemental information provided by the 150° 21 is constanted with the programm within the programm within the programm within the programm within the programm formation programm information programm information programm information programm information in Fig. 4, programm size programm information in the programm information in Fig. 4, programm size programm information in the programm information in Fig. 4, programm size programm information in the programm information in the programm information in the programm information in the programm in the programm

content provided by other servers has a target specification listed in one of the data fields.

Fig. 5 shows an except implementation of the viewer computing unit (0) in more detail. It includes a mother board 100 having a processor 102 (e.g., 86 or Pentium® microprocessor from Intel Corporation), a voisitie numery 104, and a program encoursy 106, and a program encoursy 106. The viewer computing unit of includes a digital transfer 50 receiver 50, such as a satellite dath receiver (Fig. 3). The digital receiver 50 receiver digital data broadcast over the satellite distribution network 44. The receiver 50 is coupled to a turner 110 which turner to frequencies of the satellite tamponders in the satellite distribution network 45. The move into 50 is coupled to a turner 110 which turner to frequencies of the satellite tamponders in the satellite distribution network. The turner 110 has one or two primary components: a specialized digital broadcast turner is configured to receive digital broadcast date in a particulative format, such as MPEO-mound flightal video and audio data. The generalized digital broadcast turner is configured to receive digital data in many different forms, including software programs and programming information in the form of data files.

The tuner 110 is connected to the mother bound 100 via a multi-bit bus 112, such as a 32-bit PCI (Peripheral Component Interconnect) but. The EPC database 72 is above connected to the PCI but 112, but can affertable view implemented as part of a hard disk drive 146. The programming data received at the receiver 50 is transferred over the PCI but 112 to the EPG database 72. A decryption device (root shows) for facilitating secure access to the broadcast combied PC may also be attacked to the but 112.

The viewer computing unit 60 has a video subsystem 114 connected to the PCI bus 112. The video and andio data is transferred from tuner 110 over PCI bus 112 to the video subsystem 114. The video subsystem 114 includes cisesisty for decoding MPRG-mooded or other video data formati, although such circuitry can alternatively be incorporated into the tunor 110 or moder-forced 100. The video subsystem 114 also includes video display drivers for driving a computer monitor 116.

The video subsystem 114 supports many periphenal devices, in addition to the monitor 116. For intenton, the video subsystem 114 might be connected to a laser wideo player 118 for playing DVD (digital video data), a pame machine 120 for playing video games, and a VCR (video cassatte recorder) 122 for recording programs. The video subsystem 114 is adapted for connection to an analog beautions to the video video

The mainer II fel preferable a VGA or SVGA monitor as a customary for personal computer, as opposed to a standard television. In the illustrated implementation, the viewer computing until 60 does not convert the interistical related data into an NTSC (National Television System Commission) format. In this matters, the viewer computing until 60 in able to produce television data having required computing units of in able to produce television data having required quality when disclosured on the VGA member.

The viewer computing unit 60 also includes as econd has 1.0, such an as SA (failurley Standard Architecture) bus, coupled to the mother board 100. An audio board 121 de coupled to the ISA has 1130 and serves are an interface with a number of nadio output devices, such as conventional speakers. An amplifier may be coupled to between the units board and speakers if desired. The nadio board is able completed to their subsystem 11 dev crossive doubt and singuist. The A CD ROM drive 136 is coupled to the ISA buz 130. The modio output produced by the CD ROM drive 136 is passed to the audio board 132.

The viewer computing unit 60 includes a modes 128, set a 14 Ad or 4.5 they facilities modes, accepted to the 186, bus 130. The modes 118 is connected to a conventional releption line and provides access to public networks, including the laterast. The modes 118 can be used to access and download data and applement content dereity from an independent service provider. Additionally, the modes 120 can be used for too-way communications with the constant provider arrange the propriate accept the DSS ettents. Viewer requests for programs can be transmitted over the back clause view for some content of the content provider arrange the programs can be transmitted over the back clause view for some content of the content programs can be transmitted over the back clause view for some content of the content programs can be transmitted over the back clause view for some content of the content programs can be transmitted over the back clause view for some content of the content o

An improvalue (IO) subport (40) so coupled to the ISA host ID to instruct with measures IO chrories, including a digital top driver 143, a floppy disk drive 144, and a hard disk driver 146. A remote receiver 148 is also coupled to the IO subport 140 for receiving signals from the resolut cordions keylocut 66 and remote control handed 66 in But or RF Format. Alternatively, the keyboard and handest control handed 66 in But or RF Format. Alternatively, and COMCP port 152, and an conventional settal ports, including a COMI port 150, a COMCP port 152, and an INTT port 151. An IE transmitter (not allowed on the coupled to the COMI port 150 to generate infrared signals to control determine derices, such as attents equipment, VCR, and the IBc. The computer 60 can also be hooked directly to these components.

The viewer computing unit 60 runs an operating system 160 which supports multiple applications. The operating system 160 is loaded in memory 106 and executes on the processor 102. The operating systems 160 is pratically a multitating operating system which allows simultaneous execution of multiple applications. The operating systems 160 employs a graphical turn interface windowing curviconance which presents the applications or documents in specially delinented areas of the display screen called "windows". One preferred operating system is a Windows® brand operating system soil by Microroft Corporation, such as Windows® 55 or Windows® NT or other derivative versions of Windows®. The remote hydroad 66 and landerd 86 may include customized Kyes sizulable fact use with a Windows® brand operating systems in the control of the control of the control operating systems which provide windowing caviconcents may be employed, such as the Macintosh operating system from Apple Computer,—Inc. and the OSZ operating systems IRM.

A channel navigator application 182 is strond in program memory 106 and carcentes on the processor 102 to control the state 110 to select a desired channel for necessing the wideo content programs. An EPG application 164 is stored in programs memory 106 and encourse on the processor 102 to organize programming information downloaded from the Programs information server at the content provider and cached in the EPG database 72. The EPG 104 approximating information from the EPG database 72, The EPG 104 approximating information from the EPG database 72 in a unable format for the viewer, as will be deserbled below with reference to Fig. 6. The EPG is configured to enable the viewer to define questies which intelligently identify and gather programs the viewer would like to

The viewer computing unit 60 has a browser 166 which is kept in memory 106 and dynamically loaded on processor 102 when needed to render content, such as a hypertext document, from an ISP or other content provider. The browser166 can be implemented as a hyperlink browser, or more particularly, as an Internet Web browser.

It is noted that the operating system and applications can be stored on the hard disk driver 146, or other storage medium (floppy disk, CD ROM, etc.), and loaded into the program memory for execution by the processor.

It in further nord that the broadcast enabled personal computer 60 is a fully functional computer which can perform the typical decicity applications families to computers. A variety of different applications can be loaded and accussed on the victor computing unit. As an example, the victor can run word processing applications, spreachest applications, database applications, scheduling—applications, function applications, function applications, function applications, function applications, function applications, industrial applications, and so forth. The victors operated the applications using the keyboard 66.

Fig. 5 shows an example ERO UL 170 which is presented on a cliptoy 171.

EPO UL 170 includes a channel panel 174, a time posal 166, a program grid
178, and a program semanary panel 180. Channel panel 176 growthen a vertical
corolling filst which disprings multiple channel than 112 at any one time. Each
channel the 181 includes a channel matter and a channel material
channel than 182 includes a channel matter and a channel material
companies of the channel panel 174 defines rows or program tate in program grid 177.

The panel 176 is a borteronti, contenses corolling from less with markings
denoting half-from rime segments. Time panel 176 defines columns in program
rid 178.

Program grid 178 consists of multiple program tiles 184 organized in channel-based y-axis and time-based x-axis. The grid is located to the right of channel pasal Trit and below time panel 176. Each program tile and say secondary program tile and say secondary program descriptive information, such as cloud profess, steero, etc. The illustrated occus shows an example programing line-up-option, steero, etc. The illustrated steero shows an example programing line-up-option of the 200 p.m. to 1000 p.m. PST. Thumsday, March 7, 1946. The program office to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically with respect to their networks CSS and NDC and vertically and respect to the steel program and the species properties of the viscous. Additionally, although the layout is above a capazinel according to channel neuther, the same information can be presented in a channel absence prosentation where no reference is made to channel numbers.

The viewer controls the program selection with a single focus frame 186 which is graphically overhid on the program gold 178. Focus frame 186 can be moved up or down, or left and right within a channel like up, to choose a decirred reorgam. The remote control handset or keyboard (or other menipulating mechanism) can be used to position the focus frame 186 within the EFG UL 170.

Program numery panel 100 includes a text description window 185 and a preview window 195 and 1. The text description window 185 displays program information related to the program that is highlighted by the from frame 185 in program grid 176. Here, the NBC program "Scientide" is highlighted and the text description window 188 lists the program tide "Scientide" and a program description of the current espence. The text description window 188 might also include other program related information like closed-exploring, seeze, etc. The preview window 190 as weld in fighty clips of the selected highlighted show, nuch as preview of 60° spinioff show.

The data he fill the various tiles and virations is drawn from the EPG database 72 or from URL resources on the Internet 54. The data is materiated in data structure 88 (Fig. 2) which is transmitted as pregram records from the content provider over the strettler enswick to the viewer computing usin and cashed in the EPG database 72. The EPG application 164 insents the appropriate data records into the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurems the focus frame 186 council for the EPG UI 170 for display as the viewer measurement the EPG UI 170 for display as the viewer measurement the EPG UI 170 for display as the viewer measurement the EPG UI 170 for display as the viewer measurement the EPG UI 170 for dis

The EPG UI 170 also includes hyperlinks 192 which are supplied with the program records received from the content provider, embedded in the program streem, or provided in a data stream from arbitrary source which has been associated with the program. The hyperlinks can be inserted into the channel tiles -182, program tiles 184, or the description window 188. In the Fig. 6 illustration, the hyperlink "More" is provided in the description window 188 to reference target resources that contain additional information about this episode of the "Seinfeld" show. Other hyperlinks in the description window 188 include "Last Week" which references a target resource containing information on the previous week episode, and "Comedy Club" which links to a target resource having video coverage of comedian Jerry Scinfeld performing at night clubs. The target resources referenced by the hyperlinks might be located at the content provider or at an independent service provider. The target resource might further be located locally, having been pre-cached by the system. For instance, the system might procache supplemental information about certain shows before they air based on predictive viewing tendencies, or as part of a promotional data broadcast advertising the show. This permits local interactive functionality between the

viewer and the viewer competing unit, in addition to full network interactive functionality between the viewer and the program provider.

The BPG UI 170 has special operator butters 174-200 which arrange for certain neits. A "view full recent" butter 194 allows the viewer to view the opportunit in full screen. A "recent" butter 194 allows a user to initiate procedures to record a currently playing program, or schedule to record an unpounting program. For scheduling, the viewer imply drags the record ion and drops it on a program in 184 of an appointing program, an exceptibilitied by the second ion drapped on the "Carolline in the Carly" program ide.

A "remind" button 198 is used to set reminden which notify viscour's of scheduled shows. A viewer might, for example, ware to be reminded of a program being played libre in the day and hence, dang a reminder icon to the suitable program file 184. When the start time of the requested program approaches, the EPG will ontify the viewer through a pop-up icon or the like that the program is about to begin. An "add to favories" button 200 is provided to metable a viewer to add a personn to a redefined like of favories.

The dag and drop aspects described above are perfectably implemented using object linking and embedding (OLE), which is commercially available from Microsoft Coxposition under a technique jessow as "Acceptance" Colle is an extensible service architecture built on the Composent Object Model (COM) which is both language independent and location independent. OLE supports an OLE Drig and Drey which is widely used in Windows-Occupitable opening options, such as Windows-Os OLE Drig and Drey which is widely used in Windows-Occupitable opening options, such as Windows-Os OLE Drig and Drey which is widely and in Windows-Occupitable opening options, such as Windows-Os OLE and COM have been well documented and will not be explained in decila. For more information regarding OLE and COM, effect to CLE 2. Programment's Reference and Institute CLE 2. Second Edition, but is a contract of the contr

published by Microsoft Press of Redmond, Washington, and both of which are hereby incorporated by reference.

The EPG UI 170 also presents predefined query buttons 202-210. Activation of these query buttons trigger a query of the EPG database 72 to identify programs satisfying the prodefined query parameters. The EPO 106 enables a viewer to create their own queries and to produce a soft button on the EPG UI 170 for quick retrieval of highly used queries. As an example, the FPG UI shows cutries for favorite programs. Star Trek programs, comedies, the Oorah Show, and old movies. The "favorites" query button 202 recalls a list of programs that the viewer has previously identified as favorites using the "add to favorite" button 200, or which have been automatically defined as favorites by the EPG. The "Star Trek" query button 204 and "Opeah" query button 208 initiate queries of the EPG database 72 for all Star Trek and Oprah shows that might be playing within a particular time frame. As the number of channels increases and programming grows dramatically, several different channels might carry Star Trek or Oprah, concurrently or at different times. The "comedies" query button 206 initiates a query of the EPG database 72 for all comedy programs. The "old movies" query button 210 locates all old movies that are showing.

Some of the predefined query buttons are preset outogerens, such as the "considire" and "old movine" buttons, walls other query buttons are delined by the viewer, such as "Ster Tries" but "Opals" buttons. The preset category buttons can be added and removed from the EPO UI frough a separate window which allows a viewer to add or substant canaptories from a list of modallels categories.

According to one aspect of this invention, the EPG 154 is configured to automatically develop queries to identify programs that a viewer is likely to want to with based on viewing preferences of the viewer. The EPG application collects viewer preferences in a number of ways. One technique is to log the amount of time that each channel is selected for viewing, with the underlying assumption that the viewer is watching that channel. Each channel is then assigned in own percentage of the eather viewing period as an indication of the viewer's preference. The EPG generate as equery to identify-famathe based upon this percentage, so that channels which the viewer tends to watch most other appear at the bottom of the list. The EPG generate that in an a certable list in the EPG UI, with the highly watched channels appearing at the up and the least watched ont opposet at the bottom of the list. The EPG generate that has a certable list in the EPG UI, with the highly watched channels appearing at the up and the least watched onto opposeting at the same technique can be applied to individual programs or entirevolt, (athen then channel) is logged and the last is ordered with the frequently wasched programs being listed on top and the last watched comment beat intend on the bottom.

Another technique is to create a viewer profile for each viewer. The viewer is asked a novies of questions discord at discovering the viewer's likes and dislikes. This question-and-answer sension is accomplished using a separate graphical UI which asks questions and enables viewers to choose among responses, such as "terongly ides," "like," "like," "distink," and "strongly dislike." Rether than discrete assesses, the question-and-answer screen might include dislores which enables viewers to choose somewhere in a acule between opposing preferences of "strongly dislike" and "strongly like." The EPG compiles the viewer profile and correlates the profile with clustering dists to generate a query for possible programs. The clustering data represents as accumulation of other viewers.

preferences. By matching the viewer profile with similar profiles, the EPG can better determine what the viewer will most likely want to watch.

Once the IPO 164 has extraordically compalled a list of likely favoriton, the FoR presents the list in a UI screen. This scores can be called, for example, by softwaring the "firm/order" button 202 in IPO UI For Its list is presented as its own reduced, closed loop of available programs which has actively weeded out into popular channels. The viewer can then surf the closed list by sequentially cycling intough the programs.

The EFG UI. 170 Also presents a "fixed" better 212 which a vicever uses to create histher own query. Activation of the "Fixed" batter 212 opens another UI window which assists a viewer in centific a query. Fig. 7 above an example find "window 220. The find window 220 present vicious search parameters for the window 200. The find visious 220 present vicious search parameters for the owner to search, it is is example, the viewer on soled as program game from a gene box 222, a program only-gover from a sole-game box 224, and as program search for the control of the control

To produce more advanced queries, the viewer can select an advanced query button 232. Fig. 8 shows an example advanced find window 240. It enables a viewer to create particularized queries and organize them in a tabled folder. The advanced find window 240 can also be such to constant entitivities queries which function to restalt or limit selection of programs for viewers without appropriate premissions levels. For instance, preceds can sot permission levels for their children so larged onto the viewer computing susi, the children are logged onto the viewer computing susi, the children are prevented from watching certain programming content or from ordering certain errors. A present injustic the example, with a messic as child from watching as R or NC month movies. To create a restrictive query, the parent children for "don't find" orgion to convert the query from an inclusive query to an occulative energy.

An "3d tab" batton 242 and "remove the" batton 244 allow the viewer to manage the operior. The viewer cas also save operior by chicking on the "spor" button 246. Preferably, the operior are seved in a hierarchic query structure of the EPG dambate. This cashles viewers to define directories and sub-directories of quories. Organizating queries in a hierarchic structure is advantageous because the structure conforms to the computer wide of the viewer computing unst and avails itself in memory management applications and tech manile on the computer. As the memory management applications on the seather of saved questies pure, the equal pointenties not be seather of law of the memory of the computer, as a common in personal computers, to locate a particular query. The query structure can also be presented in a U. lot the viewer as an organization that sharing the binerarity of directions, and become an apparent of the computer of th

The EPG can also be configured to respons a query editor to allow the rivers to create essentially any type of query based on key word descriptions, and to offit such queries, to establish type of officer which can be employed with the EPG is a query editor used in a program entoted Chemesiatió by Microsoft Corporation, which enables a comparte user to create queries for locating cinemo trivial tender on the CDROM.

To assist the viewer in defining a query (either by using the "Fine" Ut or the query offsite), the EFO can provide viewate which gains the viewer with stepsyon princations through the query contain. One caseage is visual for generating a simple query is to safe the viewer if the program selected is clauses for its mass, or for its claused. A viewer might request to always be above any programs which one must cell several regions of the containing the programs which can not be served in the containing the programs which can not cell several regions.

Once a query is defined, the viewer can execute the query to initiate a search of the programming information in the EPG database 72. The queries function as a filter which diff strough the programming information and returns early those items which satisfy the parameters, or in the case of a cystociole query, prochools those intens that satisfy the parameters.

Fig. 9 is a diagramment illumentes of how a query operaties to filter out programs which do not satisfy the criteria. Box 25 counts as representation programs found in the EPG database 72. Suppose a viewer defined a science fiction (Sci-Fr) query using the advanced fined window 240, as shown in Fig. 8, to Doute Sci-Fr programs. The EPG explosates 164 excents the Sci-Fr query 252 colored and vincover the programs database to a local list of Sci-Fr programs, as presented in the UI as a closed loop list which can be cycled by the viewer for selection of a particular coverage.

Fig. 10 demonstrates a restrictive query which functions to filter out and remove programs which are prohibited under the query. In this example, the EPG applies a extrictive query filter 256 to the programs set 250 in the EPG database which eliminates programs rated PG or R. The short list provided in box 258 is without PG or R tand programs.

Figs. 11 and 12 illustratus another supect of this invention in which the IPO is configured to merge multiple queries into a unified query. Suppose, for example, that multiple members in a family wast to wich a program together, but are not zero which program. Typically, each family member individually actus the program things, or surfs the channels, to find one or two programs than are most intensented in wastening. After everyone is through with his or he independent search, they discuss about which program to watch. The EPO 164 eliminates this problem by creating complex composite queries which merge multiple single single acrices.

Fig. 11 shows an example UI window 260 having a folder organization which maintains queries for individual viewers. In this example, a family of

four—Dad, Moin, John, and Suc—each lawe their own the and folder which lies their personalized queries. That is, each family member has previously defined one or more queries and stered them in their personal folder. The Mom folder holds queries for emissical programs, programs on France, and the Seinfeld coorsens. Table I shows the oursing for all family nemedies.

Table 1: Family Queries

| Family Member | Queries |
|---------------|----------------------------|
| Dad | Sports, Comedies |
| Mom | Musicals, France, Seinfeld |
| John | Star Trek, Action |
| Sue | Cartoons, No R-rated |

When the family sits done to worth a program topother, one vinew can cancers a merge specific attention of the control of the control of the fore example, so CR Scotton. The Brolean OR Sanction returns a true result of any one of the parameter sets is sent. In Fig. 12, a program set 22 is filtered using Dark query filter(3) 240, Morel query filterity 264, Softer query filterity 265, And Sarky query filterity 276, The requirement satisfying a feast one of these queries is placed in the program pood 277, from which the family members can choose a program. It is need that the finally filter can be alternatively yet to combine using a set interest method or Boolean AND Sanction which resums a program only if the query parameter or of eath family generate is not.

Notice that some programs are fisted because they settinfy a single query (e.g., US Open Golf is selected by Dad's query filter 264). Other programs may

satisfy more than one query. For example, the program "Seinfield" satisfies Mom's Seinfield query and Dad's comodies query. The animated movie "Aristocats" satisfies Mom's France query and Soo's cartoon query.

Fig. 3 Shutestas the data flow for the programming data used by see EFG application, and how the capty filters at the past the data. Suppose that the viewer is wratching the viewer computing unit 60 at 1:00 PM, as indicated by the clock 230. Broadcast digital vides are duello data, along with the digital programming data, are received from the salettie system at satellite reviewe 30. The programming data is eached in the local EFG database 72. In this illustration, the EFG database is shown as having bother programs with start times ranging from 1:00 PM to 1:00 PM. This represents and practice of evaluable programs, as the EFG database 72 can store thousands of programs that are available over hundreds to obscussed of the ordereds.

The viewer has defined a mention's query 262 that removes all Sci-Figures from the active EFG UI 170. In this case, the programs "Fast Test."
"Alliens," and "Sare Ward" are eliminated from the EFG UI 170. Now, suppose the viewer decides to work CNDO Addest Way at 150 FM. The viewer selected represents by highlighting and eliciting on the Matter Ways program list in the EFG UI 170. The more in the viewer consequency with tames to the chemical carrying the selected programs and the digital video data for Matter Ways is not to the VOA more like.

According to another supert of this invention, the viewer can define queries that continue to execute in background. The viewer defines the query to identify a topic of fastress, such as any programs concerning the Great Wall of Chian or any programs starting Clint Eastwood. The query is stored and periodically executed to determine if there are any programs which relate to the topic. When the query identifies a program related to the topic, the EPG automatically notifies the viewer.

Fig. 13 shows two queries that execute in background. The first query 284 identifies and notifies the viewer of all "Sciafids" programs and the second query 286 identifies and notifies the viewer of all Clint Euterwood norvins. When the viewer looks at the upcoming schedule for 2:00 PM, the EPG UI 288 shows all programs from the filtered version of the EPG UI 170 which show at 2:00 PM, such as the US Open Golf and Scinfeld. The EPG UI 288 also shows any programs identified by the background queries as a result of searching the EPG database 72. Here, the background queries 284 and 286 identified a Seinfeld program playing at 2:00 PM and a Clint Euterwood movie "Pale Rider" at 6:00 PM. Since there is a conflict at 2:00 PM, the viewer can choose between the Seinfeld program and the US Open Golf program.

Since the movie Pale Rider is not until 600 PM, the viewer can place a notification ion 290 on the acreen to remind him/her of the program. The viewer clicks on the program, drags it from the EPG UT 288, and drops it at another location on the screen. The drag-and-drop operation results in creation of an instruction to tune the visual display unit to the program upon activation of the ion. The EPG can flash the ion, or cause some other visual change, when the start time of the roream nears.

The EFG can also automatically create these reminders, without intervention of the viewer. When the EFC identifies a program, such as Pale Rider in response to the background quary 286, the EFG can be configured to automatically set an icos 290 on the screen for the viewer. The viewer can also set an option for the EFG to limitate recording of the program in the event that the viewer doen nit timely sativate the iron prior to the scheduled viewing time. In this mones, if the viewer is smalled to waith the programs at the schedule time, the EVD itentifiquely queries the deshales for upomining programs, incentifier any programs that meet the viewer's search parameters, notifiers the viewer, and records the program if the viewer is smalle to waith it. There are other records the program if the viewer is smalle to waith it. There are other integrables return that may be not based to the queries, such as automatically develociting information about the identified program, calling particular content from the Web, or learnabing a purchasing application to purchase goods related to the identified surrous.

This example illustrates consument use of multiple filters including personnel background filters and an active general filter. The EPG can be "configured to perform any number of openies, such as any restrictive queries for the logged on viewers, then any general queries, and then any background queries to filter the programs found in the EPG database to a message-table set of preferred procurates.

Another appect of this invention is to persold question which filler information from the EFG database and from one or unare Web sizes on the information from the EFG database and from one or unare Web sizes on the information to the user in a single UI. The questies for the Web sizes or other information on the interact can be active questies that readily filter during online communications with the Internet, or questes that filter information in a local case filter with between the activities of the internet data.

Fig. 14 is similar to the armagement of Fig. 13, but shows the effect of queries operating on both the EPG database and an Internet Web site. Fig. 14 whose two queries, an EPG database query 282 which filters data in the EPG database 72 to remove all solence fiction programs and a Web cache query 392 which filters a Web cache 294 to locate only news programs. The Web cache 294 contains recently retrieved from one or more Web sites on the internet.

The results of the two queries are displayed together on UI 296 to present a list of options to the viewer. The viewer can optionally select programs served by the content provider over the primary distribution network, or content served by the latenset provider over the Interest. By using an integrated UI 296, the viewer might be unsware as to the source of the content.

Fig. 15 shows a cycick find wandow 900 supported by the ERG application 164 which presents another technique or capitles a viewer to untire class from a numeric keyped on the remote control handset. The numeric keyped is a conventional 0-9 digit keyped. Numbered keyp 2-9 also have letters associated with them, similar to a conventional belphone, except the number "7" key includes the letter Q and the number "8" key includes the letter Z. Table 2 above the securities of the letter A. Table 2 above the securities of the sumber when the properties of the sumber that the properties of the sumber of the properties of the properties of the properties of the sumber of the properties of the properties

Suppose a viewer wants to watch a particular program or network, but cannot remember what channel it is on. Remember, there are expected to be hundreds or thousands of channels, and trying to locate a particular program or network by memorizing each channel number may prove furile. To decouple the association of channel numbers to networks and programs, the EPG enables the viewer to enter data from the 10-key keypad for both channel numbers or letters in the program or network name. The EPG performs the mapping to identify any program, channel, or network that matches the entered data.

The quick find window 300 is activated by pressing one of the keys on the remote control handset. With quick find active, the viewer presses individual keys on the remote control handset to enter data, one digit at dime. As each key is depressed, however, the EPG does not know if the viewer intends to enter a number or a letter. Accordingly, for each key, the EPG constructs a query which interprets the data as possibly representing a number or one of the letters associated with the numeric key. The EPG then executes the query to identify any EPG data item (i.e., channed, program, network, etc.) that satisfies the query. As the viewer continues to enter digits, the EPG constructs and executes queries to continuously agrees the first mild only a few EPG data items satisfy them.

With reference to the example shown in Fig. 15, suppose the viewer is interested in watching the Orlando Magic baskehall team. The viewer activates the quick find window 300 and bugins entering the word "Magic". The viewer first depresses the "o"-key, which has the associated letters M, N, and O, to enter

the letter "M" in "Magic." The EPG constructs a quory for all EPG items beginning with the digit "6," "M,", "N," or "O." In Booless logic terms, the query is represented as follows:

The symbol "*" means that any digit or digits can follow the number or letter shown. The query returns a long list of items, including the following examples:

Query 1: 6* or M* or N* or O*

MTV

Chicago Bulls at Orlando Magie Seattle Mariners v. Boston Red Sox

Market Wrap

Magical World of Science

Magic Kingdom at Disney World

Orlando Magic v. Chicago Bulls

Nashville Live

NBC

Nick-at-Night Outer Limits

Comh

Channel 6

Channel 61

The viewer next depresses the "Z"-key, which has the msociated letters A, B, and G, to ester the letter "a" in "Magsc". The EPG constructs a query for all EPG items in the first list having a next digit beginning with "2," "A," "B," or "C." In Boolean logic terms, the query is represented as follows:

Query 2 = 62* or MA* or MB* or MC* or NA* or NB* or NC*
or OA* or OB* or OC*

The query returns a shorter list of items, including the following examples:

Query 2

Chicago Bulla at Orlando Magic Seantle Mariners v. Boston Red Sox Marieta Wrap Magical World of Science Magic Kingdom at Disney World Orlando Magic v. Chicago Bulla Nasiville Live NBC Channel 62

Channel 621

The viewer next depresses the "4"-key, which has the associated letters G.

H, and I, to enter the letter "g" in "Magic." The EPG constructs a query for all EPG items in the first list having a next digit beginning with "4," "G.", "H." or "I." In Boolean logic terms, the query is represented as follows:

Onery 3 = 624* or MAG* or MAH* or MAI* or MBG* or MBH* or OCG* or OCH* or OCI*

The query returns a much shorter list of items, including the following:

Query 3

Chicago Bulls at Orlando Mastic Magical World of Science Magn: Kingdom at Disney World Orlando Magie v. Chicago Bulls Channel 624

By entry of the third digit-the letter "g"-the list of possible programs, networks and channels has been dramatically reduced to a short list that can be presented to the viewer. If the viewer continues to enter the letters "?" and "c" in "Magie," the list is pared down to four items shown in the quick find window 300 in Fig. 15. The viewer can then choose a program from the list by clicking on the appropriate program title. In response, the viewer computing unit tunes to the channel carrying the selected program.

An alternative technique to searching on each number or letter is to pre-map the program and network names into associated identification numbers which can be stored as part of the data record in the EPG database. For matance, the network name MTV has an associated identification number "68," where the letter "M" is mapped to the number "6," and the letter "V" is mapped to the number "6," and the letter "V" is mapped to the number "8," and the letter "V" is mapped to the number "8," and the letter "V" is mapped to the number "6," and the letter "V" is mapped to the number "6," and the letter "V" is mapped to the number of the pre-mapped identification number, the EPG can simply search on each numerical data and return all channel number, and all programs with identification numbers as defined the number of the pre-mapped in the number of the nu

The quick find feature is very useful to the viewer. The viewer need not use the remote keyboard to enter names of programs or networks (although the keyboard may be used). Instead, the viewer enters the data using the 10-keytopped on the remote control handest and the EPG simultaneously considers all possible measings of the data. Although this may seem laborious, entry of just a few digite (e.g., 3 to 6) is often mifficient to reduce the set of possible channel numbers, programs, and network names to only a few which can be conveniently disclosed to the viewer.

The quick find feature is described above as performing a new set of queries after each digit is entered. However, the EPO can be alternatively configured to avail eavy of multiple digits before performing the queries. For instance, the EPO can keep track of the sequence of entered digits, and the various permutations of possible terms combinations within the sequence, and then subsequently perform section of hose possibilities.

It is noted that the above example describes the viewer as entering data using a knypad on the remote control handset. In other embodiments, the EPG is configured to present a keypad of soft buttons (i.e., buttons shown as part of the graphical UI on the monitor) which the viewer can select using a handact or some other remote device to enter the data. Additionally, the viewer can enter channel numbers, program names, and network names using the remote keyboard.

It is noted that the term "program" in represented in examples as traditional delivers, or novies. The term "program" is not to be limited, however, to only these formes of programming. The term "program" is to be given a broad monthing, including any type of inclonations or data that can be carried over a restrict over programma (see, financial records or programs, solvented materials, communications records, poffware, document files, and the like.

The query-base EPG system described benefit is defined appears because it followingly decouples the association of channel from network and programs. The viewer can create simple queries to search or presentaged entegoine or complex queries to search better profess. The EPG permits reviews to many duties individual queries into a composition copy, which offers treasmont convenience for groups of viewers. The EPG also permits a viewer to save quartes in a committee this excitor. The saved queries can also be loaded into a surrown for consoline on this time fewer terms have viewer companying and.

The invention has been described in language more or less specific as to suscertant and methodical features. It is to be understood, however, that the invention is not limited to the specific features described, since the means herein disclosed comprise preferred forms of putting the invention into effect. The invention is, therefore, claimed in any of its forms or modifications within the

| | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | ٠ | |

An electronic program guide (EPG) organizes and presents programming information to the viewer and allows for creation of queries to facilitate both simple and complex searches of the programming information. According to one aspect, the EPG is configured to automatically identify programs that a viewer is likely to prefer. The EPG collects viewing preferences of a viewer and, based upon the these viewing preferences, automatically develops queries for identifying programs that the viewer is likely to want to watch. The FPG further enables multiple viewers to merge their individual queries into one composite query or to run queries in background to periodically check for programs and notify the viewer when a program is identified. Queries are saved in an EPG database in a hiorarchic structure with directories and sub-directories to make it easy for a viewer to organize and retrieve queries. Another aspect concerns creating queries for a channel, network name or program name using a 10-key keypad. The viewer enters digits in the number or name, one digit at a time. With each entry, the viewer might intend to enter a number or letter. The EPG is configured to interpret the data as recresenting all possible choices, including the number and letters associated with the key. For instance, when a viewer depresses the key with number "5." the EPG interprets that data to mean "5" or "i" or "k" or "l." The EPG identifies all programs, channels, and networks which begin with the number or letters. As the viewer continues to enter data, the list of programs, channel, and networks dynamically narrows so that after a few button presses, the viewer is presented with a short list of possible choices.

2. Representative Drawing

Fig. 3
